CELORIS

PRIVATE AI. BUILT TO ACT.

Strategic Startup Proposal

Market research, commercial strategy, product architecture, and brand identity direction

MARKET THESIS	AI adoption is widespread; measurable enterprise value and agent governance remain uneven.
STRATEGIC WEDGE	Private, cost-aware agentic workflows for mid-market organizations in Vietnam and Southeast Asia.
BUSINESS MODEL	Paid discovery → workflow pilot → production deployment → managed AI operations.
BRAND PROMISE	Your data. Your models. Your control.

Prepared 20 October 2026 | Version 1.0

Research-led proposal. Market forecasts are attributed to their publishers; pricing and financial projections are explicitly labeled as internal planning assumptions.

01 / EXECUTIVE DECISION

Build CELORIS around outcomes, control, and unit economics

CELORIS should enter the market as a private AI systems engineering company: it designs, integrates, and operates agentic workflows that solve defined business problems under explicit data, permission, quality, and cost constraints. It should not launch as a generic chatbot studio or claim to be a full horizontal AI platform before the product and customer evidence exist.

STRATEGIC RECOMMENDATION

Lead with one high-frequency workflow in a defined customer segment, prove measurable value in 6–8 weeks, and convert successful pilots into production deployments and recurring managed AI operations.

13%

of CIOs reported significant or transformational enterprise value from AI. [3]

Gartner, 19 Oct 2026

1 in 5

AI use cases succeeded, according to Gartner's 2026 survey. [3]

Gartner, 19 Oct 2026

80%

of surveyed firms lacked mature governance for autonomous agents; only one in five had it. [5]

Deloitte, 2026

The investment thesis

- Adoption is no longer the only problem. Buyers increasingly need production reliability, workflow redesign, governance, and evidence of ROI. [3][4][5]
- Agentic software is forecast by Gartner to approach US$985 billion in spend by 2030, at a 62.7% CAGR from 2025; this is a broad analyst forecast, not CELORIS's addressable market. [2]
- Vietnam's updated national AI strategy (August 2026) emphasizes AI as a core capability in design and operations, while its Personal Data Protection Law took effect on 1 January 2026. [7][8]
- A services-led entry reduces initial product risk: paid discovery and pilots generate revenue and reveal repeatable components that can later become proprietary software.

What CELORIS should be known for

Promise	Proof point customers should be able to verify
Private by design	Documented data flows, defined retention, controlled access, and clear deployment choices.
Built to act	A named workflow completed end-to-end with guardrails, tests, logs, and escalation rules.
Efficient by measurement	Cost, latency, quality, and successful-task rate benchmarked before and after deployment.
Domain-aware	The solution reflects the customer's SOPs, business rules, systems, and operating constraints.

02 / MARKET EVIDENCE

The market is expanding; value capture is the harder problem

Gartner forecasts worldwide AI spending of US$2.596 trillion in 2026, up 47% year over year, and US$3.493 trillion in 2027. The measure includes AI infrastructure, software, services, models, and related spending. It describes the scale of the AI ecosystem, not a serviceable market estimate for a startup like CELORIS. [1]

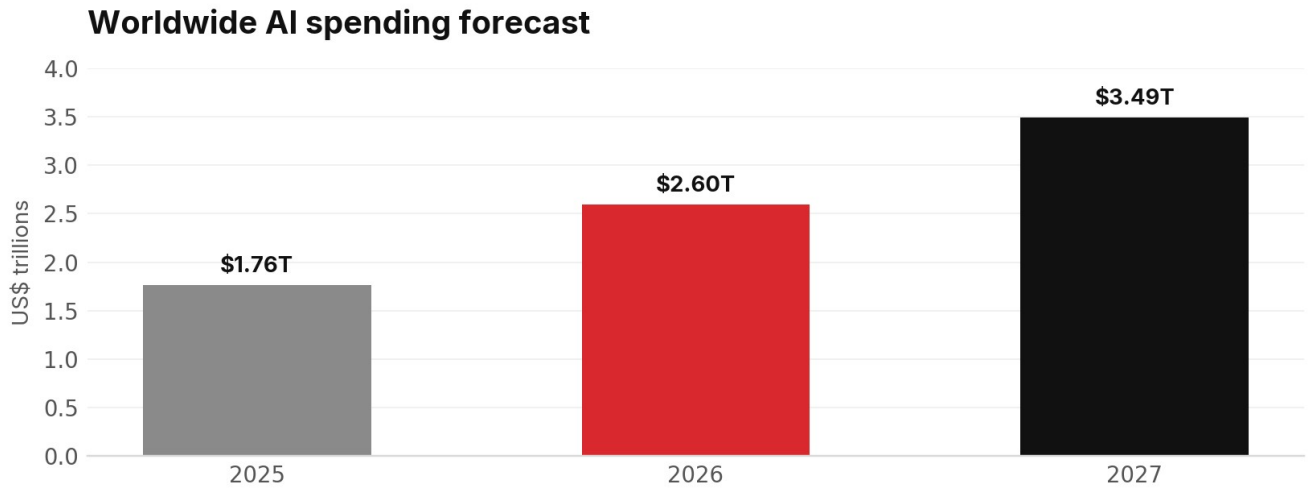

Figure 1. Worldwide AI spending forecast, US$ trillions. Source: Gartner, May 2026. [1]

Spending mix makes systems engineering relevant

Gartner category	2025	2026	Strategic relevance to CELORIS
AI infrastructure	$976B	$1,432B	Capacity, deployment choices, and inference operating cost.
AI services	$436B	$586B	Implementation, integration, and managed operations.
AI software	$283B	$453B	Agentic applications and reusable workflow products.
AI cybersecurity	$26B	$51B	Controls and safer adoption of AI in business systems.

These categories are broad and may include purchases by hyperscalers and technology vendors, not only enterprise buyers. Gartner says infrastructure represents more than 45% of 2026 spend, which cautions against treating total market spend as immediately addressable customer demand. [1]

Three demand signals

- Agentic software: Gartner's public forecast abstract projects US$985B of agentic AI software spending by 2030 (62.7% CAGR, 2025–2030). Treat this as directional analyst forecasting; the market definition is broader than CELORIS's offering. [2]
- Software economics are changing: Gartner estimates up to US$234B of enterprise application spending could be exposed to agentic arbitrage by 2030, roughly 20% of SaaS spending, as agents perform cross-system work. [11]
- Cost accountability is intensifying: 58% of CIOs reported increased pressure to deliver AI cost improvements, while 51% expected AI to increase technology total cost of ownership. [3]

03 / ADOPTION AND REGIONAL CONTEXT

Broad adoption creates a production, governance, and trust gap

88%	70%	Single digits
of surveyed organizations used AI in 2025. [4]	**used generative AI in at least one business function. [4]**	**AI-agent deployment was still in the single digits across nearly all business functions. [4]**
Stanford AI Index 2026	Stanford AI Index 2026	Stanford AI Index 2026

The adoption gap is the opportunity: the same Stanford AI Index reports that 88% of organizations used AI in 2025, while agent deployment remained in the single digits across nearly all business functions. Deloitte's 2026 survey of 3,235 senior leaders in 24 countries found only one in five companies had mature governance for autonomous agents. [4][5]

Southeast Asia: demand is real, but the digital economy is not CELORIS TAM

US$305B	US$135B	US$2.3B+
forecast 2025 digital-economy GMV across ASEAN-10. [6]	**forecast 2025 digital-economy revenue, including digital financial services. [6]**	**reported investment in 680+ Southeast Asian AI startups over the prior 12 months. [6]**
Google / Temasek / Bain	Google / Temasek / Bain	Google / Temasek / Bain

These are regional context metrics, not CELORIS's market size. The 2025 e-Conomy SEA report says regional digital-economy GMV was on track to exceed US$300B, and more than US$2.3B had been invested across over 680 AI startups in the prior twelve months. Investors surveyed highlighted software, services, AI, and deep tech in Vietnam, Singapore, and Malaysia. [6]

Vietnam: strategic timing

- The National AI Strategy approved in August 2026 frames AI as a core capability across business design and operations, moving beyond simple insertion of AI into existing products and processes. [7]
- Vietnam's Law No. 91/2025/QH15 on Personal Data Protection entered into force on 1 January 2026. Product architecture, contracts, retention, access, cross-border handling, and vendor dependencies should be reviewed with qualified counsel. [8]
- For cross-border sales, the EU AI Act's transparency requirements became enforceable on 2 August 2026, while other obligations have staggered timelines. Applicability depends on the solution and role in the AI value chain. [9]

> **REGIONAL RECOMMENDATION**
>
> Use Vietnam as the initial delivery base and Southeast Asia as a practical expansion region; sell outcome-based implementations rather than attempting to compete in foundation-model training or hyperscale infrastructure.

04 / CUSTOMER AND USE-CASE STRATEGY

Start narrow: a repeatable operations workflow, not a horizontal platform

CELORIS needs a focused entry point where customer access is achievable, the workflow has visible cost or delay, data ownership matters, and success can be measured within 6–8 weeks. The initial segment below is a strategic hypothesis to validate through customer discovery, not a claim that market size or willingness to pay has already been proven.

Primary ideal customer profile (ICP)

Dimension	Initial target hypothesis
Organization	Mid-market companies in Vietnam with 10–100 locations, multiple departments, or repeated back-office workflows.
First vertical hypothesis	Multi-location FnB operators with inventory, supplier, reporting, and SOP workflows.
Buyer / sponsor	COO, CFO, Head of Operations, CIO/CTO, or digital transformation lead.
Technical conditions	At least one structured data source plus documents, APIs, or repeatable SOPs; a named operational owner.
Pain indicators	Manual reconciliations, recurring reporting work, high exception volume, inconsistent SOP use, or uncontrolled AI usage.
Disqualifiers	No accountable workflow owner, no baseline data, no permitted data access, or no clear path to measurable value.

Use-case prioritization

Use case	Value potential	Risk / friction	Recommendation
Supplier invoice + purchase-order exception triage	High: repetitive, measurable, cross-system	Medium: financial records; human approval needed	Pilot candidate
Daily operations report with narrative explanation	Medium-high: saves management time	Low-medium if read-only and source-linked	Early pilot
Internal SOP / policy assistant	Medium: faster access to trusted procedures	Source freshness and access control	Pair with workflow
Inventory / replenishment exception assistant	High for multi-site operators	Requires clean POS/ERP and business rules	Phase 2
Finance / economics research assistant	High-value knowledge work	Higher confidentiality, quality, and buyer scrutiny	Adjacent segment after references

Initial product thesis

PRIVATE OPERATIONS COPILOT

A controlled assistant that reads approved internal sources, detects defined exceptions, prepares recommendations or draft actions, and records the evidence behind each output. Actions that affect money, customers, inventory, or external communications require explicit policy and approval.

If CELORIS already has stronger founder access in finance or professional services than in FnB, reverse this order. Distribution access and an accountable buyer matter more than the attractiveness of a sector label.

05 / COMPETITIVE LANDSCAPE

Compete at the integration-and-outcomes layer

CELORIS will operate in a crowded ecosystem. The defensible position is not that competitors lack AI or privacy features; many platforms now provide orchestration, access controls, self-hosting, or routing. CELORIS must differentiate through workflow-specific engineering, deployment flexibility, evaluation, and accountable outcomes.

Competitive layer	Representative alternatives	What they are good at	CELORIS response
Cloud and model platforms	Microsoft / Azure, AWS, Google Cloud	Infrastructure, managed models, enterprise distribution	Remain complementary and provider-aware; avoid a single-model dependency where useful.
Workflow automation	n8n and other automation platforms	Rapid integrations; visual workflows; self-hosting options. [13]	Use when appropriate; add domain logic, agent controls, evaluation, and operating accountability.
Agent frameworks	LangGraph and similar developer frameworks	Flexible orchestration building blocks	Productize the lifecycle around a real customer workflow: testing, permissions, monitoring, and support.
LLM gateways and routers	LiteLLM and similar gateways	Model routing, load balancing, retries, cost-based strategies. [14]	Integrate routing as a capability; differentiate on end-to-end business outcomes, not the gateway alone.
Enterprise AI / system integrators	Large consultancies and vertical specialists	Scale, procurement trust, broad transformation capabilities	Focus on speed, founder-level accountability, mid-market access, and reusable solution patterns.

Positioning whitespace

- End-to-end: business problem → data access → agent workflow → permission policy → test harness → production monitoring.
- Provider-neutral by design: choose hosted or self-hosted models based on data constraints, quality, latency, cost, and availability.
- Evidence-led: define acceptance tests and an economic baseline before pilot approval; publish measured outcomes with customer permission.
- Reusable engineering: move common connectors, evaluators, guardrails, deployment patterns, and monitoring into repeatable internal assets.

> **AVOID THIS TRAP**
>
> Do not build a broad multi-agent platform before repeated customer demand is demonstrated. Start with services and orchestration built on mature tools; own the differentiation in deployment, data boundaries, evaluations, and domain workflow design.

06 / PRODUCT AND SERVICE ARCHITECTURE

A services-led entry with a productization path

The first commercial offer should be an engineered workflow system supported by reusable components, rather than a generalized SaaS platform. Productization should be earned through repetition: the same workflow, connector pattern, evaluation set, controls, and customer outcome must recur before becoming a standalone product.

Layer	Recommended capabilities	Commercial value
1. Workflow / domain layer	SOP interpretation, policies, forms, business rules, industry-specific evaluation cases.	Fits the way the customer actually operates.
2. Agent execution	Orchestration, task decomposition, tool calls, retries, deterministic validations, human handoffs.	Completes controlled multi-step workflows.
3. Knowledge and data	Approved source connectors, access-aware retrieval, provenance, freshness checks.	Keeps answers grounded in permitted, current information.
4. Model and inference control	Model routing, context/token controls, caching, fallbacks, evaluations.	Balances quality, latency, availability, and cost.
5. Security and governance	Identity, least privilege, secrets management, audit logs, retention and deployment controls.	Reduces operational risk and improves trust.
6. Observability and economics	Task-level success, error rates, human intervention, cost per successful task, latency.	Links technology to measurable business results.

Proposed portfolio architecture

Offer family	Scope	Role in the business
CELORIS Agents	Agentic workflows, orchestration, tools, and automation.	Core implementation offer.
CELORIS Inference	Routing, caching, model selection, evaluation, and fine-tuning.	Efficiency differentiation and follow-on optimization.
CELORIS Private	Private deployment, data access design, auditability, and operational controls.	Trust and enterprise readiness.
CELORIS Domain	Reusable modules for FnB, finance/economics, and business operations.	Path to repeatable intellectual property.

Build-versus-buy rule

Buy or adopt mature infrastructure for commodity capabilities; build only where customer-specific workflow knowledge, cross-system execution, privacy controls, evaluation, or cost management create a durable advantage. Open-source and commercial components should be reviewed for licenses, maintenance, telemetry, security, and deployment fit before production use.

07 / GO-TO-MARKET AND MONETIZATION

Sell a measured workflow outcome, then expand

Commercial motion

1. Qualification: identify one process owner, a recurring task, baseline time/cost, data permissions, and a production decision-maker.
2. Paid discovery: map systems, workflow steps, failure modes, privacy requirements, acceptance metrics, and ROI hypothesis.
3. Pilot: prove one workflow in a bounded environment with explicit success thresholds, logging, and a rollback plan.
4. Production: harden identity, monitoring, retries, failure handling, auditability, documentation, and operating support.
5. Managed operations: recurring monitoring, model and prompt updates, cost reviews, regression testing, and support.
6. Expansion: add a second workflow only after the first has met acceptance metrics and earned an internal champion.

Pricing hypotheses to validate

The following are proposed starting ranges for enterprise-oriented projects, not sourced market averages. Validate through discovery calls, competitive quotes, procurement feedback, and willingness-to-pay tests before publishing a rate card.

Offer	Indicative price (USD)	Commercial structure
Discovery / architecture sprint	$2,500–$7,500	Fixed fee; data and workflow assessment plus pilot plan.
Bounded workflow pilot	$8,000–$20,000	Fixed scope, 6–8 weeks, acceptance criteria agreed upfront.
Production deployment	$20,000–$80,000+	Milestone-based based on integration, security, and workflow complexity.
Managed AI operations	$1,500–$8,000 / month	Monitoring, maintenance, evaluation, cost reports, and support tiers.
Inference optimization audit	$5,000–$15,000	Baseline, experiments, savings validation, and prioritized roadmap.

Customer acquisition

Channel	Initial execution
Founder-led outbound	Build a named 50–100 account list; sell workflow diagnosis to operations and technology leaders.
Referral partners	POS/ERP implementers, cloud partners, data consultancies, and specialist technology agencies.
Proof assets	Publish anonymized before/after metrics, architecture diagrams, a security brief, and a reproducible demo.
Thought leadership	Practical content on agent control, private deployment trade-offs, and cost per successful task; avoid generic AI hype.

08 / ILLUSTRATIVE FINANCIAL MODEL

Use the first 12 months to prove repeatable delivery

IMPORTANT ASSUMPTION

The model below is a founder planning scenario, not a market forecast and not evidence of existing customer demand. It excludes taxes, financing, founder salaries, hiring, sales costs, cloud/LLM cost of goods sold, receivables timing, and one-off product development unless separately budgeted.

Year 1 base-case revenue build

Revenue line	Planning assumption	Revenue
Discovery / architecture sprints	5 × $4,000	$20,000
Paid workflow pilots	5 × $12,000	$60,000
Production deployments	3 × $30,000	$90,000
Managed operations	3 clients × 4 months × $2,500	$30,000
Total modeled revenue		$200,000

Year 2 base-case revenue build

Revenue line	Planning assumption	Revenue
Discovery / architecture sprints	8 × $5,000	$40,000
Paid workflow pilots	8 × $15,000	$120,000
Production deployments	6 × $35,000	$210,000
Managed operations	8 clients × 7 billed months × $3,000	$168,000
Inference optimization audits	5 × $8,000	$40,000
Total modeled revenue		$578,000

What must be true

- Year 1: 5 paid pilots and 3 production deployments are achieved; the model assumes the team can convert project delivery into recurring support.
- Year 2: reusable delivery patterns allow higher project values and more managed accounts without increasing headcount linearly.
- A year-end target of 8 managed customers at $3,000 per month implies $24,000 MRR, or $288,000 annualized recurring revenue run-rate; this is a target, not recognized Year 2 revenue.
- Track implementation gross margin, support burden, cloud and model costs, payment delay, sales-cycle length, and customer concentration before using the model for fundraising.

Finance discipline

Do not report token savings based only on a lower API bill. Compare equivalent task sets and quality thresholds; measure total cost including infrastructure, engineering effort, retries, human review, latency, and maintenance. Commercial success depends on unit economics at the workflow level.

09 / EXECUTION ROADMAP

A 12-month path from proof to repeatability

Phase	Timing	Primary deliverables	Gate to proceed
0. Customer discovery	Weeks 1–4	15–20 buyer interviews; 3 workflow maps; security and data checklist; shortlist of design partners.	At least 3 qualified buyers confirm urgent workflow pain and an owner.
1. Paid pilots	Months 2–4	2–3 bounded pilots; baseline measurements; evaluation sets; deployment options documented.	At least 2 pilots meet pre-agreed acceptance criteria.
2. Production hardening	Months 4–7	Identity, logging, guardrails, retries, fallback behavior, support model, incident process.	One deployment operates on real workload with acceptable quality and economics.
3. Repeatable delivery	Months 7–10	Reusable connectors, templates, automated tests, runbooks, case study with permission.	Delivery hours per deployment decline without reducing quality.
4. Productization decision	Months 10–12	Product boundary, recurring-revenue model, roadmap, architecture and security review.	Evidence of repeated demand across at least 3 customers.

North-star and operating metrics

Metric	Definition	Initial target / decision use
Successful task rate	Share of eligible cases completed to acceptance criteria.	Define per workflow; baseline before pilot.
Human intervention rate	Share of cases requiring manual correction or escalation.	Trend down while preserving safe escalation.
Cost per successful task	Total inference + infrastructure + review/ops cost divided by successful completions.	Primary efficiency measure; compare like-for-like.
Latency / cycle time	P50 and P95 system latency plus end-to-end elapsed time saved.	Agree acceptable response and process-time thresholds.
Grounded / policy-compliant output	Evidence-backed output rate and policy violations in test sets.	No production expansion without acceptable evaluation.
Reliability	Tool success, timeout, retry, fallback, and incident rates.	Monitor continuously, with clear owners.
Commercial proof	Pilot-to-production conversion, time to deploy, gross margin, MRR, logo concentration.	Validate repeatable demand and sustainable delivery.

DECISION RULE

Stop or redesign low-value pilots. Gartner’s October 2026 survey found only 31% of CIOs had guidelines for stopping pilots before production and 17% had guidelines for abandoning low-value production initiatives. CELORIS should make decision gates a visible part of delivery. [3]

10 / BRAND PLATFORM AND MESSAGING

A premium technical brand with a privacy-first point of view

Core brand platform

Element	CELORIS direction
Brand essence	Controlled intelligence in action.
Primary tagline	Private AI. Built to act.
Supporting line	Your data. Your models. Your control.
Category descriptor	Private Agentic AI · Inference Optimization · Domain Intelligence
Brand promise	Build useful AI systems that operate within defined boundaries and are measured against real outcomes.
Personality	Minimal, precise, calm, capable, premium, technically credible.
Avoid	AI hype, exaggerated security claims, robot imagery, and generic “digital transformation” language.

Messaging hierarchy

- Primary: “Private AI. Built to act.” — connects privacy with operational execution.
- Trust: “Your data. Your models. Your control.” — describes architecture and deployment choices without promising absolute security.
- Efficiency: “More useful AI. Less inference waste.” — use only when supported by measured benchmarks.
- Execution: “From reasoning to real-world action.” — supports orchestration and workflow automation.
- Homepage statement: “We engineer private, efficient AI systems that automate real workflows, optimize inference, and adapt to how your business operates.”

Homepage copy proposal

HERO

PRIVATE AI. BUILT TO ACT.
Agentic systems engineered for real workflows—with privacy and inference efficiency built in.
Primary CTA: Explore Solutions | Secondary CTA: Talk to Our Team

Tone of voice

Use	Instead of
“Reduce cost per successful task by X% on this workflow.”	“Cut AI costs by 90%” without comparable benchmarks.
“Supports self-hosted deployment in the following configuration.”	“100% private” without architecture and contract evidence.
“Automates this workflow with approval checkpoints.”	“Fully autonomous business” as a broad, unbounded promise.
“Measured on this test set and workload.”	Universal performance claims based on a single demo.

11 / CELORIS VISUAL IDENTITY BOARD

Reference template for the identity system

The image below is the latest CELORIS guideline concept supplied in this project. It is included as a visual reference for brand direction and application mockups, not as production-ready vector artwork or legal clearance of the name.

Figure 2. CELORIS brand guideline concept: logo variations, positioning, palette, typography, principles, website, app icon, presentation cover, and report cover.

Identity decisions to preserve

- Keep the circular C-inspired black symbol and diagonal red slash as the signature mark.
- Retain the custom CELORIS wordmark and red dot above the “i”; the custom R should follow the angular reference treatment while keeping the rest of the wordmark unchanged.
- Keep the system restrained: black and signal red as the core logo colors, with white and gray reserved for backgrounds and interface hierarchy.
- Use the same logo lockups across website, app icon, favicon, presentation, and technical report; maintain clear-space and minimum-size rules.

12 / VISUAL IDENTITY SPECIFICATIONS

Create consistency without decorating the brand

Color system

CHARCOAL BLACK	SIGNAL RED	WHITE	GRAPHITE	MIST
#111111	#D9292F	#FFFFFF	#8A8A8A	#F3F3F3

Usage principle: white is the default canvas; black carries the wordmark, headlines, and key copy; red is a deliberate action accent; gray supports secondary information and UI structure. The logo should generally remain black + red, with reverse variants for dark backgrounds.

Typography system — revised

Role	Recommended family	Usage
Wordmark	Custom-drawn lettering	Do not substitute the designed CELORIS wordmark with ordinary typed text.
Headlines	Inter Display Semibold / Bold	High-contrast titles and section headers; tight but comfortable line spacing.
Body and UI	Inter Regular / Medium	Readable paragraphs, navigation, body copy, and interface labels.
Technical tables	Inter Medium / Regular	Use tabular figures where possible; avoid a monospaced display aesthetic.
Long-form documents	Inter or Aptos as fallback	Use clear hierarchy, 10–11 pt body text in formal documents, and generous line spacing.

> **TYPEFACE DECISION**
> The system uses Inter / Inter Display for a clean, contemporary technical look. JetBrains Mono is not part of the proposed identity. For code or data-heavy visuals, use Inter with consistent alignment; a monospace face is optional for actual code snippets only, never a core brand font.

Logo and layout rules

- Maintain a clear-space margin at least equal to the height of the red slash around the symbol and wordmark.
- Do not stretch, outline, shadow, bevel, rotate, or add gradients to the logo.
- At small sizes, use icon-only artwork and simplify details rather than shrinking the full lockup.
- Use thin gray dividers, generous whitespace, disciplined grids, architectural geometry, and a small number of meaningful red accents.

13 / PRIVACY, GOVERNANCE, AND RESPONSIBLE DEPLOYMENT

Make control visible in the architecture

The CELORIS promise is only credible when customers can inspect how data moves, what an agent can do, which model providers are involved, where logs are stored, and how a workflow can be stopped or rolled back. Governance must be treated as a product capability and delivery artifact.

Control area	Minimum design evidence	Owner
Data boundary	Data-flow diagram; source inventory; retention/deletion policy; approved subprocessors.	Solution lead + customer data owner
Identity and permissions	Least-privilege service identities; scoped connectors; secret rotation; environment separation.	Technical lead / customer IT
Agent action policy	Allow-listed tools; constrained inputs/outputs; thresholds; approval and escalation rules.	Workflow owner + product lead
Quality and safety	Evaluation set; groundedness and policy tests; prompt-injection scenarios; regression tests.	AI engineer / QA
Observability	Trace ID, tool/action logs, errors, retries, fallback, operator interventions, retention period.	Operations owner
Cost and performance	Model/token usage, task cost, latency percentiles, success rate, unit economics.	AI platform owner
Incident response	Stop switch, credential revocation, rollback, incident owner, customer communications.	Technical lead + customer sponsor

Standards and regulatory design inputs

- Vietnam: account for Law No. 91/2025/QH15 on Personal Data Protection, effective 1 January 2026; map obligations to the customer's role, data types, purpose, retention, and cross-border processing. [8]
- EU-bound systems: assess whether relevant AI Act requirements apply to CELORIS, the customer, and any model/system providers; transparency rules are enforceable from 2 August 2026, while certain high-risk provisions have later timelines. [9]
- Use NIST's AI Risk Management Framework and its Generative AI Profile as a voluntary structuring reference for governance, evaluation, and lifecycle risk management; do not present alignment as formal certification. [10]
- Review open-source and managed toolchains for licensing, telemetry, data processing, security maintenance, and suitability for private/self-hosted requirements. Self-hosting does not automatically eliminate all telemetry or third-party risks. [12][13][14]

CLAIMS POLICY

Do not promise "zero data exposure," "100% secure," "fully private," or a fixed cost-saving percentage until the claim is defined, measured, and supported by the exact deployment configuration. Publish architecture-specific facts and measured outcomes instead.

14 / RISKS AND VALIDATION AGENDA

The key risks are commercial as much as technical

Risk	Why it matters	Mitigation / evidence required
No willingness to pay	Interest in AI does not imply budget or urgency.	Conduct 15–20 interviews; require paid discovery or pilot commitment.
Too many target sectors	Each vertical creates different data, workflows, buyers, and support burden.	One beachhead workflow; second sector only after repeatable proof.
Integration complexity	Customer data and legacy systems may be inconsistent or inaccessible.	Qualify systems during discovery; use narrow integration scope and data-readiness checklist.
Unreliable agent actions	An error can create business, privacy, or financial harm.	Use constrained tools, evaluations, approval gates, rollback, and incident handling.
Inference costs expand	Multi-step workflows, retries, context, and model choice can change unit economics.	Track cost per successful task; cap run budgets; route only after quality testing.
Weak defensibility	Generic model APIs and automation tools are widely available.	Build repeatable domain assets, evaluations, controls, connectors, and customer trust.
Long enterprise sales cycle	Security review and procurement can defer cash collection.	Start with tightly bounded business-owner pilots; manage cash terms and deposits.
Name / IP clearance	CELORIS name and visual assets may conflict with existing rights.	Complete domain, company-name, trademark, and logo similarity searches before launch.

First 30 days: evidence plan

1. Interview 15–20 operators and technology leaders; test pain, data constraints, existing alternatives, budget owner, and buying trigger.
2. Choose two candidate workflows and quantify baseline volume, manual minutes, error cost, latency tolerance, and exception paths.
3. Build a narrow demo against synthetic or approved sample data; evaluate at least 30–50 representative cases before customer claims.
4. Obtain 2–3 design-partner letters or paid discovery commitments; do not treat compliments or demo attendance as product-market fit.
5. Complete a lightweight data-flow/security brief, commercial terms, and a domain/name clearance plan.

Go / no-go criteria for a pilot

Proceed if…	Pause or stop if…
A named buyer owns the workflow and success metric.	No owner or no agreed baseline.
Data access and permissions are approved.	Data provenance or permitted use is unclear.
Acceptance criteria are testable before deployment.	Value depends on open-ended agent autonomy.
The economics have a credible path to positive value.	Inference, integration, or review cost overwhelms the benefit.
A production decision is planned before the pilot starts.	Pilot has no budget, date, or production gate.

15 / CONCLUSION

CELORIS should own the work between AI capability and business value

The market evidence supports a disciplined opportunity: AI adoption and spending are expanding, but enterprise value, cost accountability, and agent governance are still unresolved for many buyers. CELORIS can differentiate by engineering the complete path from data and domain context to controlled agent action and measured operational outcomes. [1][3][4][5]

> **STRATEGIC NORTH STAR**
> Private AI. Built to act.
> The system should complete the right workflow, within the right boundaries, at a cost the customer can justify.

Recommended decisions

1. Approve the positioning: private, cost-aware agentic AI systems for real operations.
2. Select one initial workflow and one beachhead segment based on founder access and buyer urgency.
3. Use paid discovery and fixed-scope pilots to collect evidence before building a broad platform.
4. Make task success, cost per successful task, privacy controls, and production reliability core product metrics.
5. Adopt the CELORIS identity system using the custom wordmark, red “i” dot, black/red logo palette, and Inter / Inter Display typography.
6. Complete legal, domain, company-name, and trademark clearance before public launch.

Research interpretation and limitations

This report combines third-party forecasts and surveys published through 20 October 2026 with CELORIS-specific strategy hypotheses. Market forecasts vary by market definition and should not be added together. Broad global AI spending and ASEAN digital-economy GMV are contextual indicators, not CELORIS TAM. Competitive examples illustrate substitute categories rather than an exhaustive landscape. Pricing, customer counts, conversion rates, and revenue plans are proposed assumptions to validate with buyers.

[13] n8n Docs, workflow automation, AI capabilities, and self-hosting Open source

[14] LiteLLM Docs, model routing and load balancing Open source

Method and scope notes

- Primary emphasis: global AI spending and enterprise adoption, agentic software forecasts, Southeast Asian digital context, Vietnamese policy, and governance references.
- Statistical scope varies: Gartner forecasts and CIO survey, Stanford AI Index synthesis, Deloitte leadership survey, and e-Conomy SEA regional projections are not directly comparable measures.
- The CELORIS visual board is a generated concept image supplied within the working conversation. The final logo should be rebuilt as precise SVG/vector artwork and checked for legibility before production.
- The proposed CELORIS name, logo, and web-domain availability have not been legally cleared by this report. Use qualified trademark counsel for release decisions.
